Appl. No. 10/696,984 Amil: dated January 8, 2007 Reply to Office action of July 6, 2006

## Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

## Listing of Claims:

Claim 1 (currently amended): A door locking system comprising:

an assembly including a latching structure-having a first undereut feature;
a door movably coupled to the assembly, the door including a latch member
having a second undereut feature for engagement with the <u>latching structure</u> first
undereut feature, the door having a closed position in which the <u>latching member and</u>
<u>latching structure</u> first and second undereut features are engaged so that the door is
latched to the assembly; and

a movable member <u>coupled</u> to the <u>door</u> for applying <del>an opening</del> <u>a</u> force on the door relative to the assembly toward an opening direction of the door, the engaged undereut features preventing the door from opening when the opening force is applied, the force operating to maintain engagement of the <u>latching structure</u> first undereut feature of the assembly with the <u>latch member</u> second undereut feature of the door to keep the door latched

Claims 2-3 (canceled).

Claim 4 (canceled).

Claim 5 (currently amended): The door locking system according to claim-1 A door locking system comprising;

an assembly including a latching structure having a first undercut feature;

a door movably coupled to the assembly, the door including a latch member having a second undercut feature for engagement with the first undercut feature, the door

Appl. No. 10/696,984 Amdt. dated January 8, 2007 Reply to Office action of July 6, 2006

having a closed position in which the first and second undercut features are engaged so that the door is latched to the assembly; and

a movable member for applying a force on the door toward an opening direction of the door, the engaged undercut features preventing the door from opening when the opening force is applied, the force operating to maintain engagement of the first undercut feature of the assembly with the second undercut feature of the door to keep the door latched, wherein the latch member includes a handle for operating the latch, the handle capable of pivoting to control alignment of the second undercut feature with the first undercut feature.

Claim 6 (previously presented): The door locking system according to claim 5, wherein the handle is substantially incapable of pivoting when the first undercut feature is engaged with the second undercut feature and the movable member is applying the force.

Claim 7 (currently amended): The door locking system according to claim 1, wherein the movable member is operably coupled to contact an element positioned between the movable member and the assembly when applying the force

wherein the movable member is capable of applying a continuous force against at least one of the assembly and the door.

Claim 8 (currently amended): The door locking system according to claim [[1]] Z, wherein the element includes a pump cassette

wherein the movable member is coupled to one of the door and the assembly.

Claim 9 (currently amended): The door locking system according to claim 1, <u>further</u> comprising a handle for moving the latch member from an engagement position to a disengagement position for disengaging the latching structure and the latch member, wherein the handle is substantially incapable of moving the latch member from the engagement position to the disengagement position when the movable member is applying the force

Appl. No. 10/696,984 Amdt. deted January 8, 2007 Reply to Office action of July 6, 2006

wherein the movable member is positioned between the door and a surface of the assembly.

Claim 10 (currently amended): The door locking system according to claim 1, wherein the movable member [fist] includes an expandable member.

Claim 11 (original): The door locking system according to claim 10, wherein the expandable member is a bladder.

Claim 12 (original): The door locking system according to claim 1. further including a pneumatic circuit for controlling the movable member.

Claims 13-17 (canceled)

Claim 18 (canceled).

Claim 19 (currently amended): The door locking system according to claim 1 A door locking system comprising:

an assembly including a latching structure having a first undercut feature;
a door movably coupled to the assembly, the door including a latch member having a second undercut feature for engagement with the first undercut feature, the door having a closed position in which the first and second undercut features are engaged so that the door is latched to the assembly; and

a movable member for applying a force on the door toward an opening direction of the door, the engaged undercut features preventing the door from opening when the opening force is applied, the force operating to maintain engagement of the first undercut feature of the assembly with the second undercut feature of the door to keep the door latched, further comprising an element positioned between the movable member and at least one of the assembly and the door, wherein the movable member is operably coupled to contact the element when applying the force.

Appl. No. 10/696,984 Amdt. dated January 8, 2007 Reply to Office action of July 6, 2006

Claim 20 (original): The door locking system according to claim 19, wherein the element is a pump cassette.

Claim 21 (currently amended): A door locking system comprising:

an assembly having a first engagement means;

a door movably coupled to the assembly, the door including a second engagement means for engagement with the first engagement means, the door having a closed position in which the first and second engagement means are engaged so that the door is latched to the assembly; and

movable means coupled to the door for applying an opening a force on the door relative to the assembly toward an opening direction of the door, the engaged undereut features preventing the door from opening when the opening force is applied, the force operating to maintain engagement of the first undereut feature engagement means of the assembly with the second undereut-feature engagement means of the door to keep the door latched

Claim 22 (canceled).

Claim 23 (original): The door locking system according to claim 21, further including a handle attached to the second engagement means.

Claim 24 (original): The door locking system according to claim 21, wherein the movable means includes an expandable member.

Claim 25 (original): The door locking system according to claim 24, wherein the expandable member is a bladder.

Claim 26 (currently amended): The door locking mechanism according to claim 21, further including a pneumatic circuit for controlling the moving member movable means.

Appl. No. 10/696,984 Amdt. dated January 8, 2007 Reply to Office action of July 6, 2006

Claims 27-29 (canceled).

Claim 30 (currently amended): The door locking system according to claim 21, where the movable means is positioned between the door and the assembly operably coupled to contact an element positioned between the movable means and the assembly when applying the force.

Claim 31 (currently amended): The door locking system according to claim [[21]] 39, wherein the element includes a pump cassette

wherein the movable means is operably coupled to contact at least one of the assembly and the door.

Claim 32 (currently amended):	The door locking system according to claim 21 $\underline{\Lambda}$
door locking system comprising:	
an assembly having a first eng	agement means;
a door movably coupled to the	assembly, the door including a second engagement
means for engagement with the first e	ngagement means, the door having a closed
position in which the first and second	engagement means are engaged so that the door is
latched to the assembly; and	
movable means for applying a	force on the door toward an opening direction of
the door, the engaged undercut feature	es preventing the door from opening when the
opening force is applied, the force open	erating to maintain engagement of the first undercut
feature of the assembly with the secon	nd undercut feature of the door to keep the door
latched, further comprising an elemen	t positioned between the movable means and at
least one of the assembly and the door	r, wherein the movable member is operably coupled
to contact the element when applying the force.	

Claim 33 (original): The door locking system according to claim 32, wherein the element is a pump cassette.

Appl. No. 10/696,984 Amil: dated January 8, 2007 Reply to Office action of July 6, 2006

Claim 34 (currently amended): A method of locking a door to an assembly with respect to which the door has an open position and a closed position, the method comprising:

engaging a first undereut feature <u>latching structure</u> of the assembly with a second undereut feature <u>latch member</u> of the door when the door is in the closed position so that the door is latched to the assembly; and

applying an opening a force on the door relative to the assembly toward an opening direction of the door using a movable member coupled to the door, the engaged underent features preventing the door from opening when the opening force is applied, the force operating to maintain engagement of the first underent feature latching structure of the assembly with the second underent feature latch member of the door to keep the door latched.

Claims 35-38 (canceled).

Claim 39 (currently amended): The door looking method according to claim 34, wherein the movable member includes an expandable member, and wherein applying the force includes expanding an the expandable member.

Claim 40 (previously presented): The door locking method according to claim 39 wherein the expandable member is a bladder, and wherein expanding the expandable member includes pneumatically operating the bladder.

Claims 41-43 (canceled).

Claim 44 (currently amended): The door locking method according to claim 34, wherein applying the force includes placing the movable member in contact with an element positioned between the movable member and the assembly

wherein applying the force includes placing a movable member in contact with at least one of the assembly and the door. Appl. No. 10/694,984 Amdt. dated January 8, 2007 Renly to Office action of July 6, 2006

Claim 45 (currently amended): The door looking method according to claim 34 A method of locking a door to an assembly with respect to which the door has an open position and a closed position, the method comprising:

engaging a first undercut feature of the assembly with a second undercut feature of the door when the door is in the closed position so that the door is latched to the assembly; and

applying a force on the door toward an opening direction of the door, the engaged undercut features preventing the door from opening when the opening force is applied, the force operating to maintain engagement of the first undercut feature of the assembly with the second undercut feature of the door to keep the door latched, wherein applying the force includes placing a movable member in contact with an element positioned between at least one of the assembly and the door, such that a force is generated on at least one of the assembly and the door.

Claim 46 (original): The door locking method according to claim 45, wherein the element is a pump cassette.

Claim 47 (currently amended): A method of locking a door to an assembly with respect to which the door has an open position and a closed position, the method comprising:

engaging a first-undereut feature latching structure of the assembly with a second undereut feature latch member of the door when the door is in the closed position so that the door is latched to the assembly; and

inflating a bladder <u>coupled to the door</u> so as to apply an opening <u>a</u> force on the door relative to the assembly <u>toward an opening direction of the door</u>, the engaged undercut features preventing the door from opening when the opening force is applied; the force operating to prevent movement of the second undercut-feature latch member of the door relative to the first undercut feature latching structure of the assembly.
